The Classical Systems Engineering Process

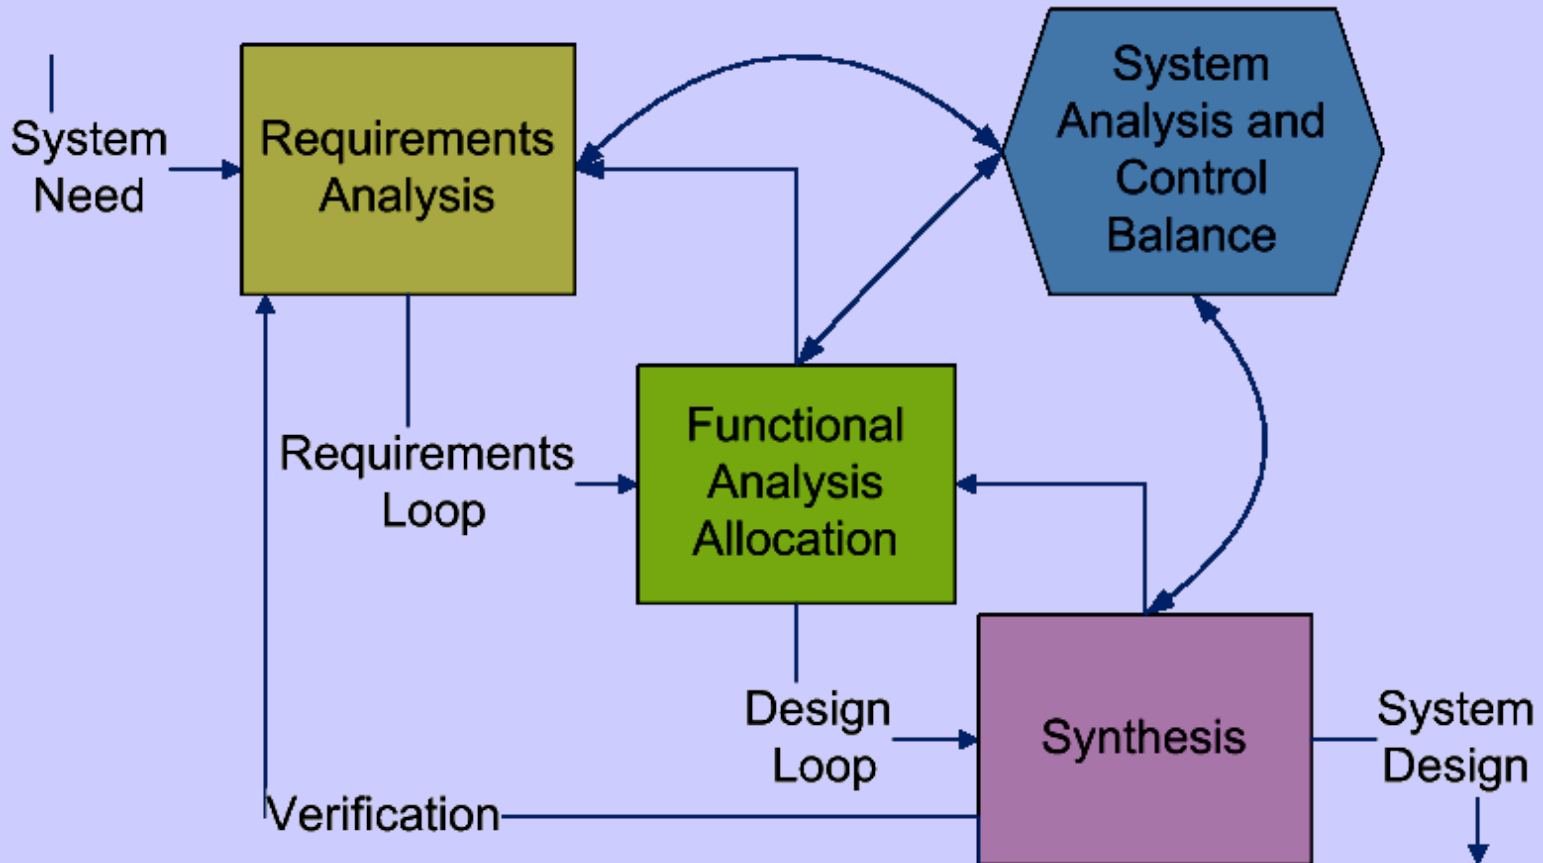

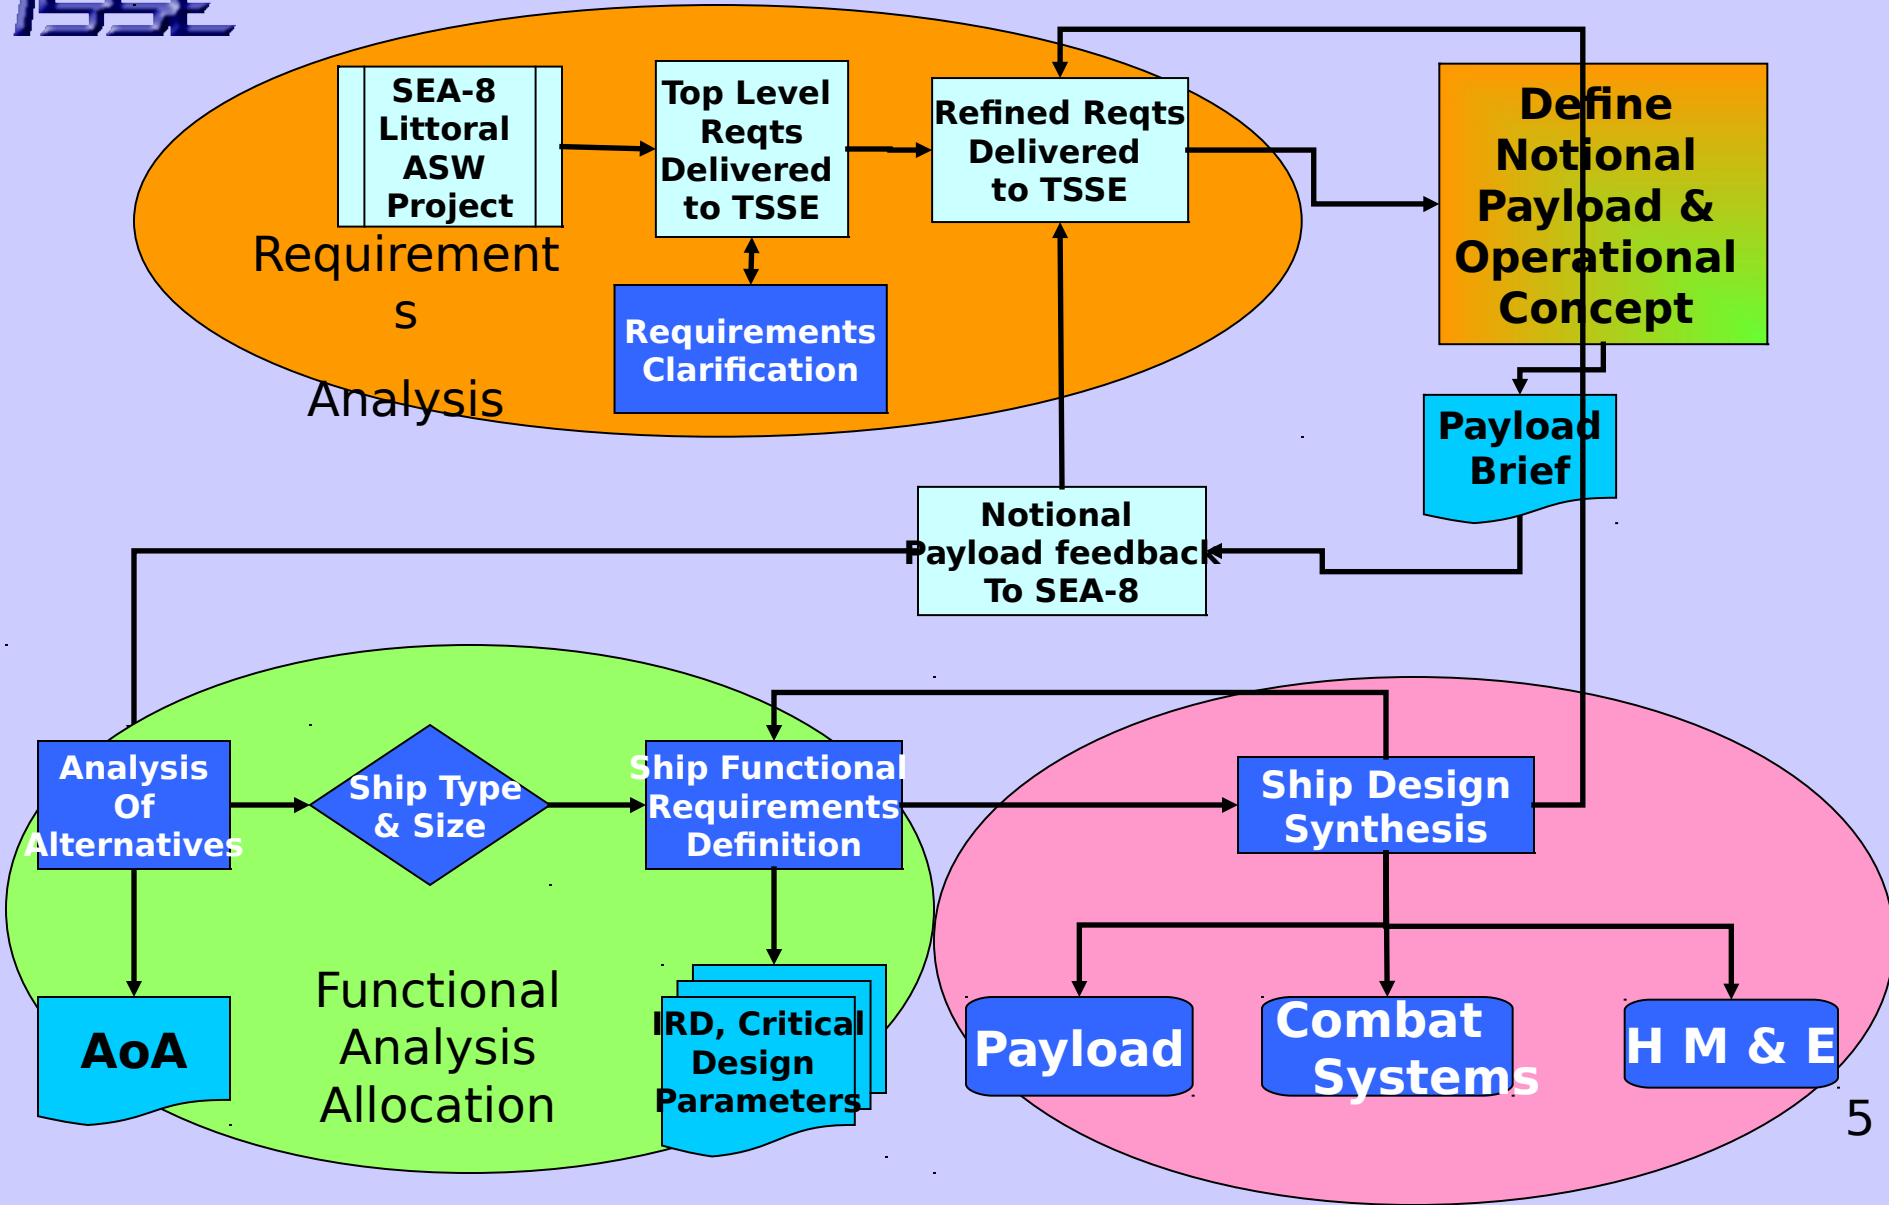

Figure from NAVSEA Ship Design Manager (SDM) Manual

TSSE Tailored Systems Engineering Design Process

Top Level Requirements

- **Deploy, retrieve, and regenerate large UUVs semi-clandestinely**
- **Sensor assets required to provide Pd 0.8 across contested OA (6,700 NM2) within 10 days**
- **Provide logistic support necessary to sustain SoS for 30 days**
- **Communicate on the following circuits:**
 - High Band Width Air/Space Line of Sight (LOS)** **LOS Data**
 - LOS Voice** **OTH Data**
 - OTH Voice** **SATCOM**
 - Underwater Data**
- **Launch, recover, and control a 7,000 lb UAV**
- **Deploy box-launcher weapons and torpedoes for enemy engagement**

Notional Payload and Operational Concept

Top Level Analysis of Alternatives (AoA)

- Conducted from Aug-Sep using notional payload architecture and SEA-8 scenario
- Competing Architectures:
 - LCAC size craft (single and wave)
 - Mid-size ship
 - LCS Module (single and wave)
- Selection Criteria:
 - Capability (30)
 - Deployability (20)
 - Survivability (20)
 - Endurance (10)
 - Flexibility (10)
 - Technical Risk (5)
 - Cost (5)

Top Level AoA Results

Critical Design Parameters

Category	Threshold	Objective
Operational Availability	0.85	0.95
Hull Service Life	20 years	30 years
Draft @ Full Load	8 m	5 m
Max Speed	30 + kts	40 + kts
Range @ Max Speed	1000 nm	1500 nm
Range @ Cruise Speed	3500 nm	4500 nm
Large UUV Capacity	40	50+
Hvy Wt UUV capacity	80	100+
Cargo Weight	400 MT	800 MT
Cargo Volume	5000 m ³	6000 m ³
Small Boat (7 m RHIB)	1	2
USV (11 m RHIB)	1	2
UUV/USV/UAV Launch Recover	Sea State 3	Sea State 4
Aviation Support	One 7000 lb VTUAV	VTUAV (2)/ SH-60R
Aircraft Launch / Recover	VTUAV	VTUAV/SH-60R
UNREP MODES	RAS, CONREP, VERTREP	RAS, CONREP, VERTREP
Core Crew Size	≤130	≤100
Crew Accommodations	125	125
Provisions	30 days	45 days

Agenda

- ✓ Introduction and Overall Design Process
- Payload and Operational Concept
 - Components
 - Launch, Deployment, and Recovery
 - Handling Systems
 - Payload Modeling
- Combat Systems
- Hull, Mechanical, and Electrical (HM&E)
- Summary

Notional Architecture

Challenge	Response
Contested air space	Covert insertion and recovery, 200nm standoff range
30 day sustained operations	Centralized hub replenishment and recovery
Time and Space: 100 nm ² in 72 hrs 6700 nm ² in 10 days	Single launch cycle followed by ongoing service cycles

10 nm X 10 nm Network Hub

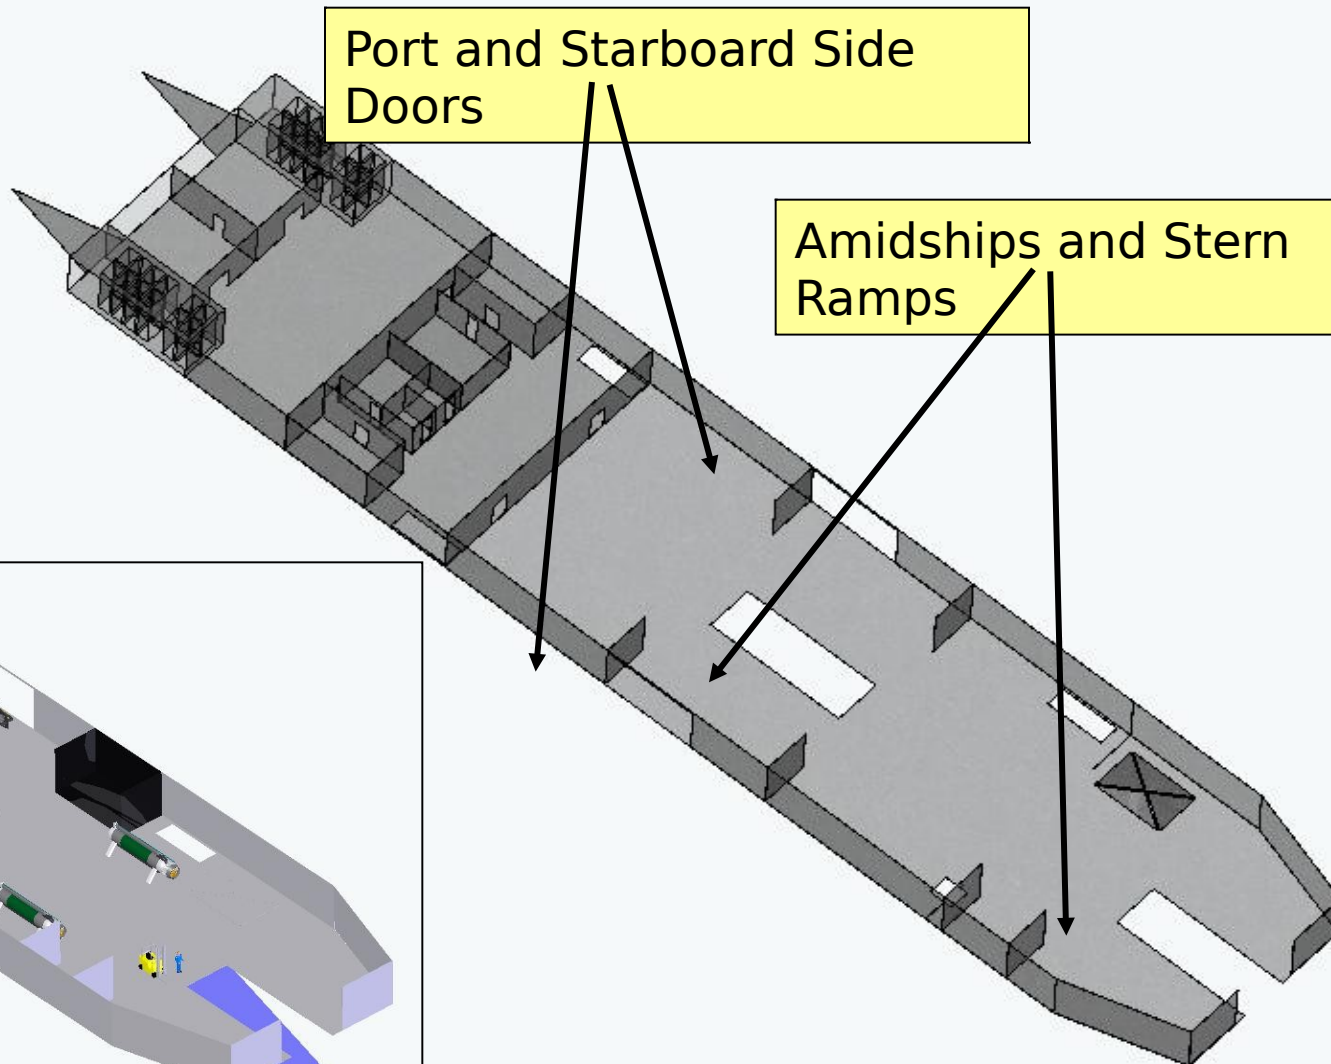

Architecture Refinement with TSSE/SEA-8 Collaboration

- 1 Large UUV (*Sea Predator)
- 1 Sled equipped with deployable RF buoy, acoustic modem, docking transducers, coupling two 21" diameter shapes
- 6 Light Weight UUVs – four for power, two for sensor processing and communications control
- 16 man-portable sensor and wire deployment vehicles

Payload Deck

Handling Systems

- X-Y-Z Overhead Hoist Array and Deck-rail Storage System
 - Longitudinal overhead monorail along centerline
 - Transverse overhead rail pairs
 - Reconfigurable two tier shelves anchored into deck rails provide secure stowage
 - Port and Starboard amidships rail extensions provide over the side lift capabilities
 - Amidships ramp cradle handles up to Large UUV's
 - Stern ramp variable geometry cradle for larger capacity launch and recovery

Notional Architecture

ASSUMPTIONS:

-1 nm Detection Radii

-Sensor Spacing:
4 nodes at 5nm

8 nodes at 4nm

4 nodes at 2nm

1 center node

Maximum Capacity: 48 fixed hubs + 48 mobile Sea Predators

Top Level Requirement: Full AO Coverage

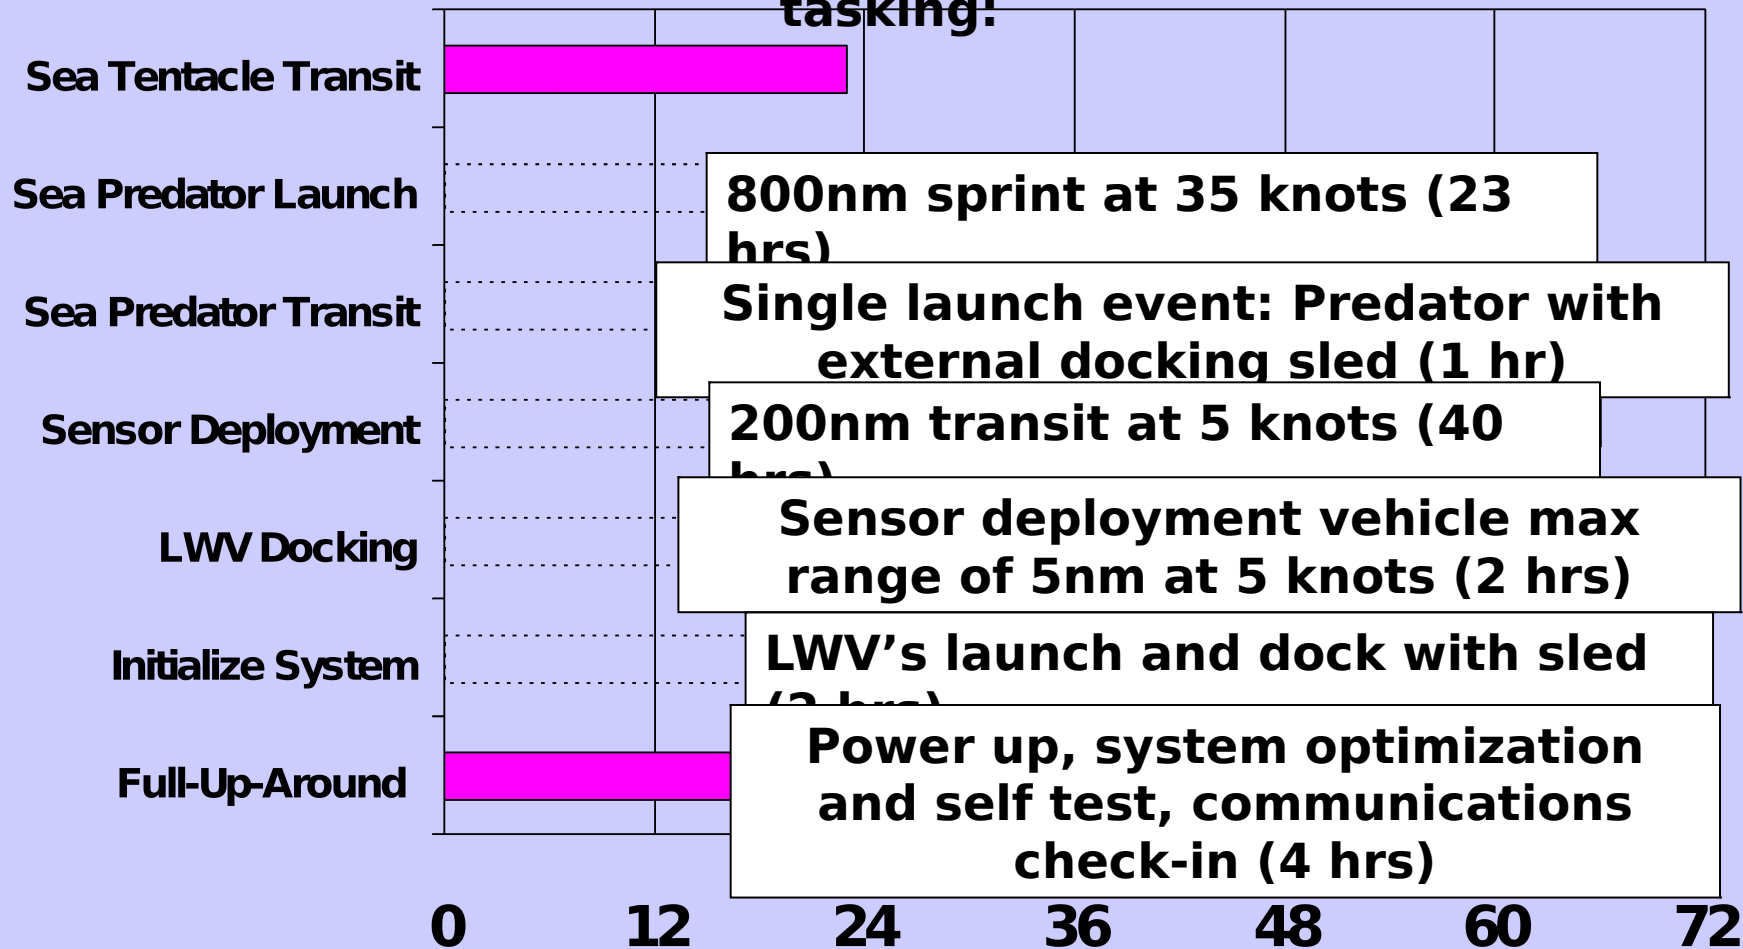

72 Hour Single Hub Deployment

Mission Range: 1000nm

Loitering at 1,000nm from the Harbor Gate AO, Sea Tentacle receives urgent tasking:

10-Day Maximum Payload Deployment

Mission Range: 3,400nm

TSSE

**In port at < 24 underway readiness, Sea
Tentacle receives urgent tasking to AO at
3,400nm range:**

UUV Network Applications

- Perimeter defense of Sea Base and high value transit lanes
- Core ASW and MIW capabilities providing offensive and defensive early warning envisioned by Sea Shield
- Wide area battle-space preparation and intelligence gathering capabilities for time critical Sea Strike

Mission Payload

Baseline Operational Unit Count

Sea Predator (Large UUV)	AN/WLD-1 (Large UUV)	11m RHIB (USV equipped)	7m RHIB	SH-60R	VTUAV
48	2	2	2	2	2

Detailed Payload Deck-Plan

Payload Top Level Requirements

- ✓ **Deploy, retrieve, and regenerate large UUVs semi-clandestinely**
- ✓ **Sensor assets required to provide Pd 0.8 across contested OA (6,700 NM2) within 10 days**
- ✓ **Provide logistic support necessary to sustain SoS for 30 days**
- **Communicate on the following circuits:**
 - High Band Width Air/Space Line of Sight (LOS) LOS Data**
 - LOS Voice OTH Data**
 - OTH Voice SATCOM**
 - Underwater Data**
- **Launch, recover, and control a 7,000 lb UAV**
- **Deploy box-launcher weapons and torpedoes for enemy engagement**

D - Detection SK - Soft Kill HK - Hard Kill

HK* - Anti-ship ESSM requires software upgrade

Defense in Depth

Inner Defense Layer

Mid Defense Layer

External Communications

RF External Communications

- The ship will be fully interoperable with the following systems:
 - CEC
 - Joint Planning Network
 - Joint Data Network
 - GCCS-M
 - SIPRNET
 - NIPRNET
- The following frequency ranges / data rates will be supported:

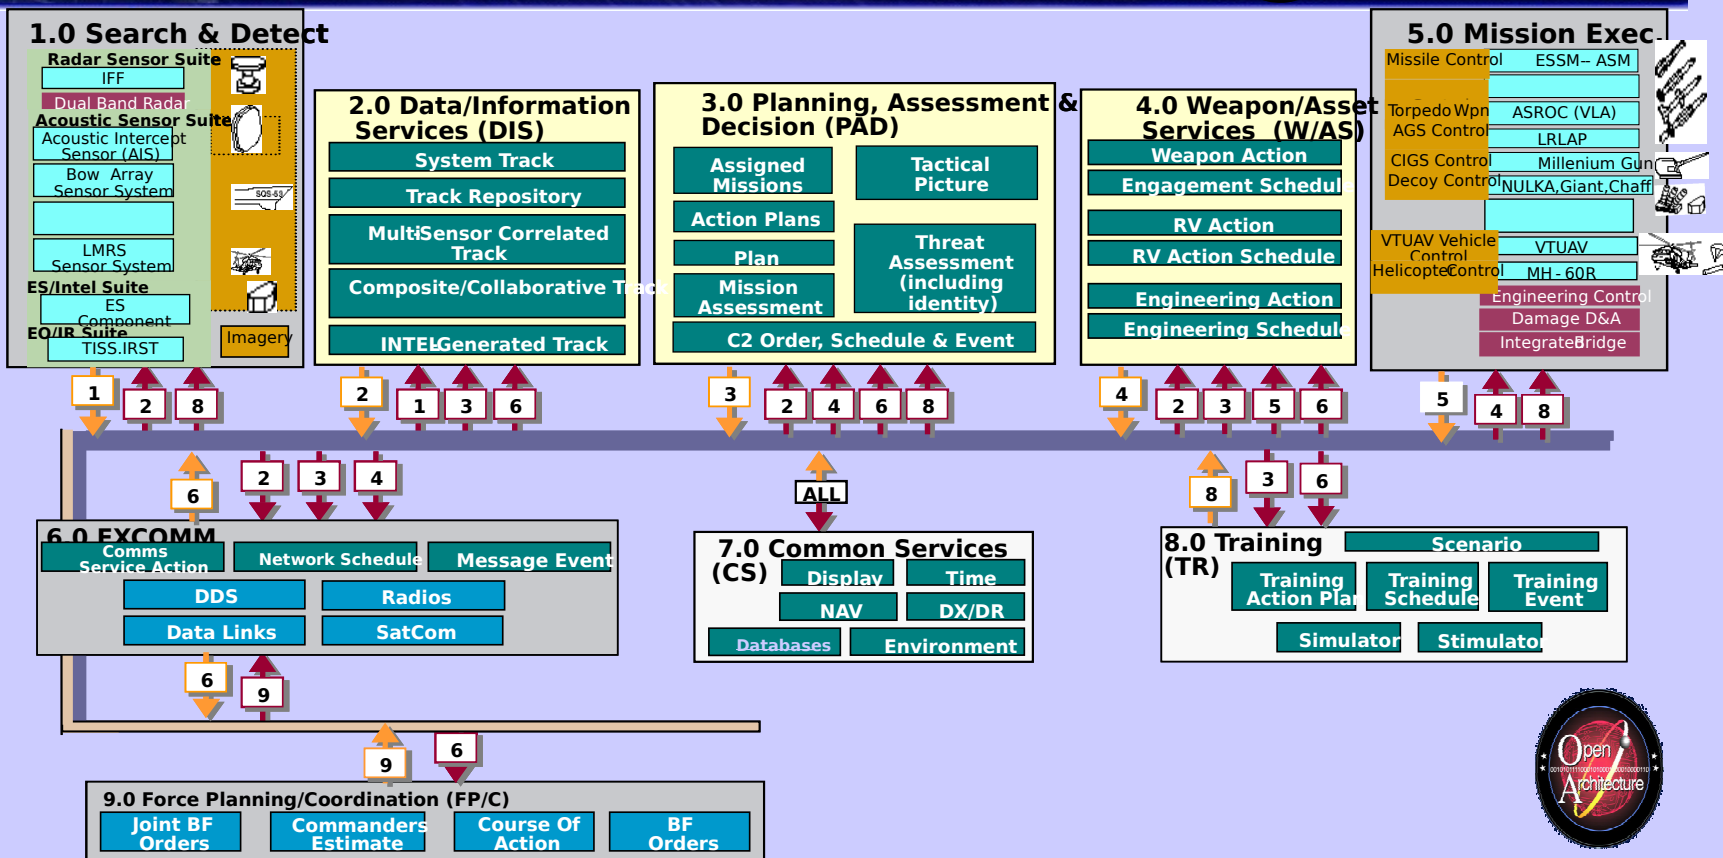

- UHF SATCOM	512 - 4.5 Mbps
- SHF SATCOM	1.544 Mbps (T-1) - 45 Mbps (T-3)
- UHF LOS	200 kbps

Integrated Combat Management System

ICMS Open Architecture Design

TENTACLE ICMS BL1.0

Operating Characteristics:

- Net-Centric
- Collaborative
- Distributed Functionality
- Strong HSI Focus

Mission Areas:

- Littoral ASW/MIW
- SUW (Maritime Surveillance)
- AAW

Inner Defense Layer AoA

Design Requirements	Weight	Sea Ram	CIWS 1B	Millennium Gun	Goal Keeper
Modularity	0.15	1.00	5.00	5.00	2.00
Personnel	0.10	4.00	2.00	3.00	2.00
Operational Availability	0.15	4.50	4.50	4.00	4.00
Range	0.10	5.00	5.00	3.00	3.50
Surface Threat Capability	0.15	1.00	2.50	5.00	0.00
Air Threat Capability	0.10	5.00	4.50	3.50	4.00
Responsiveness	0.10	5.00	4.00	3.50	4.00
Footprint (Physical, RCS)	0.15	2.00	2.00	4.00	2.00
Totals	1.00	0.64	0.73	0.80	0.51

Selected System:

Millennium Gun

- Range (air): 3.5 nm
- Range (cruise missiles) : 1.08 nm
- Range (sea-skimming missiles): 0.8 nm
- Firing Rate: 1,000 rounds/min
- 152 sub-projectiles per round

Inner Defense Layer Trade Study

Advanced Multifunction RF System (AMRFS) Capabilities

Multi-functional:

- Communications
 - Satellite Communications
 - Line-of-Sight Communications
- Electronic Attack (EA)
 - Noise Jamming
 - Deceptive Jamming
- Electronic Surveillance (ES)
- Radar
 - Surface Navigation Radar
 - Volume Search
- Reduced Maintenance
 - Array & Subsystem Calibration, Characterization, and Diagnostics

Source: Raytheon DBR

Benefits:

- Reduces Total Number of Required Topside Arrays
- Increases Potential for Future Growth without Major Ship Alterations
- Tighter Control over EMI/EMC Issues
- Functionality Primarily Defined by Software
- Potential for Substantial Reduction in Life Cycle Costs
- Enables Reallocation of RF Functions

Summary:

- RF functions can be customized to tactical environment, enhancing war-fighting capabilities !!!

W. Gottwald, "An Overview of the Advance Multifunction RF Concept (AMRFC) Test-Bed", 04APR14

Radar Cross Section (RCS) Estimation

- For our design RCS estimation, we used two techniques:
 - Empirical Method (Skolnik)
 - Physical Optics Method (POFACETS Software)

Empirical Method of RCS Estimation

- Skolnik (1980) suggested a formula to estimate the median RCS of a ship based on its displacement and the frequency of operation of a given seeker:

$$S_{m^2} = 1644 \times \sqrt{D_{KT}^3 \times f_{GHz}}$$

- For our design, with a displacement of around 7000 LT and a frequency of operation of 0.3 GHz:

$$S_{\text{Sea-Tentacle}} = 16677 \text{ m}^2 = \boxed{42 \text{ dBsm}}$$

- This approximation varies with the angle. 13 dB (for broadside) are added and 8 dB (for minima) are subtracted.

$$34 \text{ dBsm} \leq S_{\text{Sea-Tentacle}} \leq 55 \text{ dBsm}$$

Physical Optics Method of RCS Estimation

- POFACETS is a RCS tool developed by Dr. Jenn of the ECE Dept. of NPS.
- It is based on the Physical Optics Method.
- Ship Parameters used by POFACETS were generated with RHINO software.

RCS Results using a PEC material model at a frequency of 0.3 GHz

RCS as a Function of Material Selection

Composite vs. PEC (Steel)

Composite material ship yields a median RCS of approximately 5dBsm

Steel ship yields a median RCS of approximately 25dBsm

RCS as a Function of Seeker Frequency

RCS: Beam target angle for steel ship.

Steel material selection renders lowest RCS at frequencies:

- 2.3 GHz
- 4.1 GHz
- 7.2 GHz

**RCS Results using a Steel Ship model
vs. Seeker frequency at a 090/270 TA**

RCS Conclusions

- Empirical and simulation results for RCS are similar.
- POFACETS results facilitated material considerations.
- RCS Comparisons are comparable between 2004 and 2005 TSSE designs.
- RCS Analysis (unclassified) and does not take into account AMRFS RF emissions.

Combat Systems Top-Level Requirements

- ✓ Deploy, retrieve, and regenerate large UUVs semi-clandestinely
- ✓ Sensor assets required to provide Pd 0.8 across contested OA (6,700 NM2) within 10 days
- ✓ Provide logistic support necessary to sustain SoS for 30 days
- ✓ **Communicate on the following circuits:**
 - High Band Width Air/Space Line of Sight (LOS) - LOS Data
 - LOS Voice - OTH Data
 - OTH Voice - SATCOM
 - Underwater Data
- ✓ **Launch, recover, and control a 7,000 lb UAV**
- ✓ **Deploy box-launcher weapons and torpedoes for enemy engagement**

ICMS Summary

- Integrated Design philosophy can summed up as “no stovepipes.”
- Open Architecture Focus Embraces Technology Growth.
- Multi-mission capability supports dynamic mission requirements.

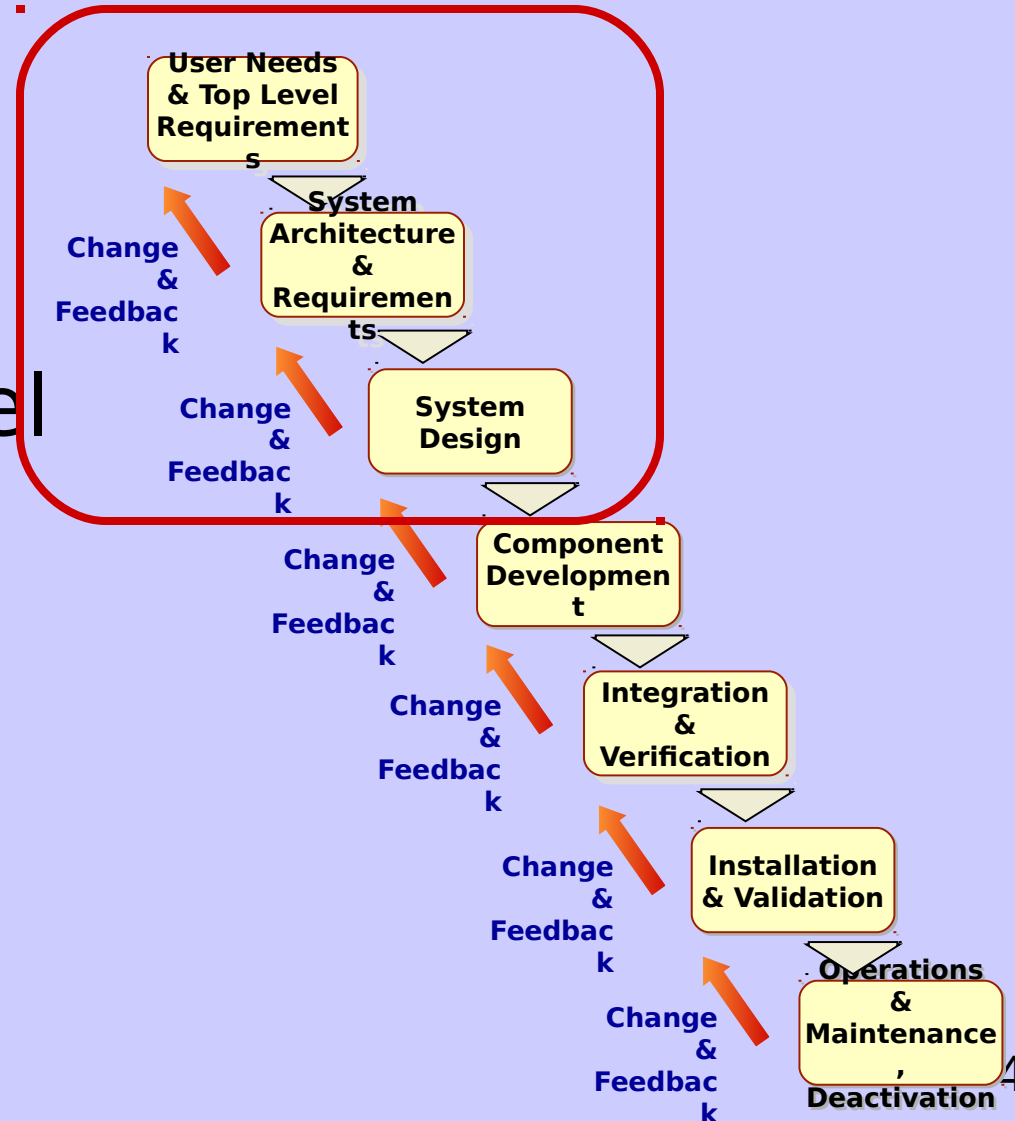

Agenda

- ✓ Introduction and Overall Design Process
- ✓ Payload and Operational Concept
- ✓ Combat Systems
 - Hull, Mechanical, and Electrical (HM&E)
 - Initial Hull Selection AoA
 - Hydrostatics, Damaged Stability, Structures
 - Resistance, Propulsion, Electrical
 - Seakeeping
 - Summary

- Systems Engineering Waterfall Model used
- Applied up to component development stage

Hull Type Comparison

Monohu

- Long endurance at low speeds
- Ruggedness, simplicity, and durability
- Tolerance to growth in weight and displacement
- Existing infrastructure of yards, docks, and support facilities is designed for monohulls
- Low cost

Trimara

- Reduced powering requirements at high speeds
- Reduced draft
- Increased deck area and growth margin
- Increased seakeeping
- Increased powering requirements at low speeds because of large wetted surface area

Catamaran

In addition to Trimaran

- Good stability after dropping off all the payload
- Advantage of using the space between demihulls as launching / recovering stations (semi-covert operations)
- Best speed for high weight / cargo load

Mission Bay Comparison

Monohull: 16 ISO
containers

Catamaran: 21 ISO
containers

Trimaran: 7 ISO
containers

Hull Type AoA

Requirement	Weight	Monohull		Catamaran		Trimaran

Hull Form

Catamaran was
selected

Hull Design

Displacement = 7023 MT
 DWL = 117.4 m
 Design Draft = 5.2 m
 VCG = 5.925 m (from keel)

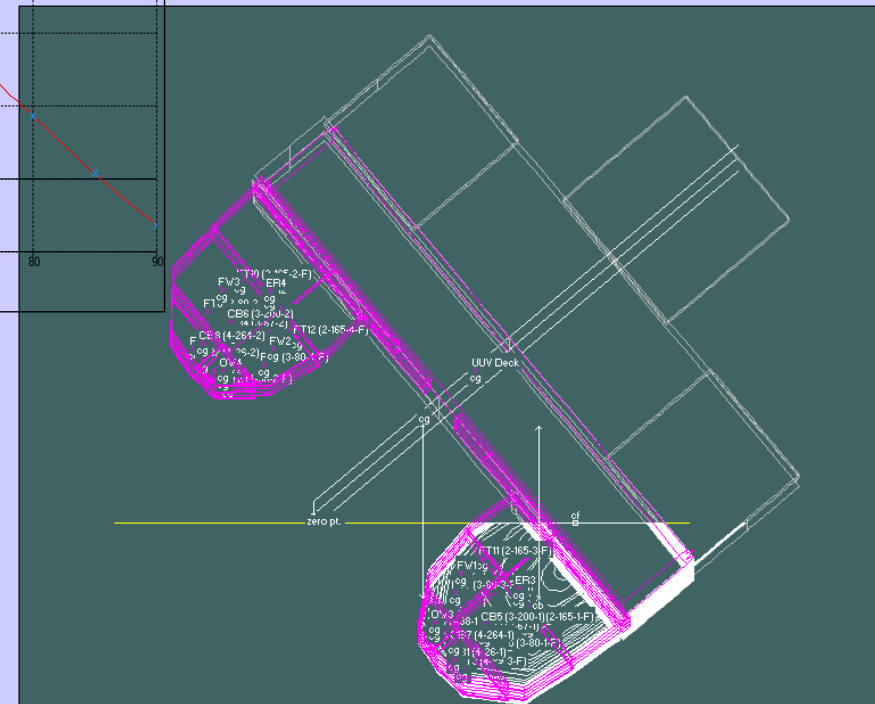

Results obtained using standard and custom hydrostatics software and weight data for the ship

Intact Stability

Positive Righting
Arm up to 85°

Damaged Stability

Can survive in case of loss of one demi-hull

Can survive with all engine rooms flooded

Steel was selected

Max. Bending Stress = 154.4 MPa at hogging condition at midship section

Ship Characteristics

Light Ship = 4504 MT

Loaded Displacement = 7023 MT

LOA = 120 m

LWL = 117.4 m

Beam = 25 m

Design Draft = 5.2 m

Metacentric Height = 16.05 m

Design Trim = 0.1° to Bow

Design Heel = 0.51° to Port

40	921.880044	40	8674

Endurance and Speed

- Transiting Speed of **20 kts** gives Range of **5,400 nm**

Max Speed 40 kts

- Sprint Speed of **35 kts** gives Range of **1,000 nm**

Summary of Chosen Motor System

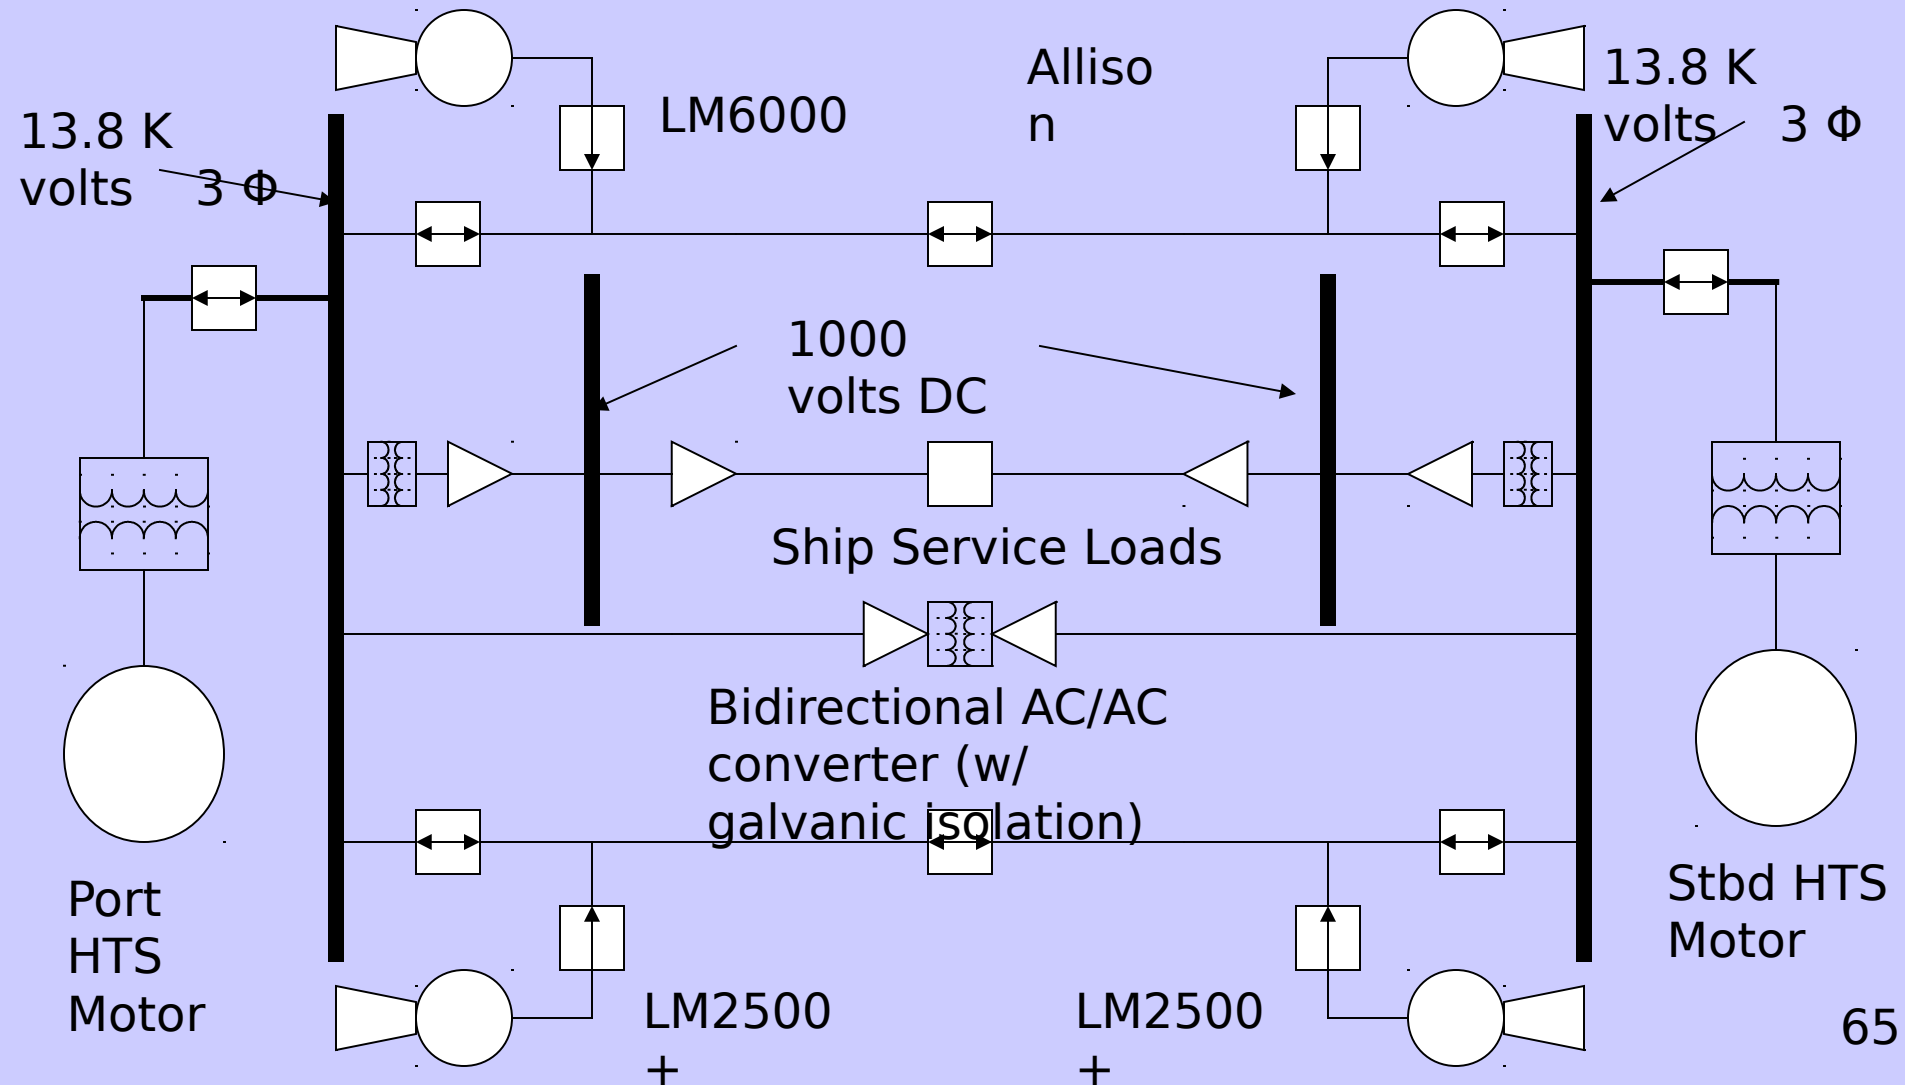

- Motor alternatives:
 - Conventional COTS motor
 - Superconducting DC Homopolar motor
 - High Temperature Superconducting AC motor
- High Temperature Superconducting Synchronous AC Motor Selected

Integrated Power System

- IPS is an AC/DC hybrid zonal
- Total capacity is 103 MW
- 93 MW required for 40 knots, 6MW for ship service loads, 4 MW reserve
- Gas turbines produce 3 phase 13.8 kVolt AC
- All ship service loads distributed via 1000 volts DC

Zonal Distribution

Seakeeping Results

- Evaluate response in regular seas; varying ship speeds and headings.
- Within linear theory, evaluate response in random seas using regular wave results.
- Assume long-crested, fully developed seas.
- Set limiting values of the response and calculate the operating envelope.
- Adjust design parameters to achieve an acceptable operating envelope.

Speed-Polar Plot

Limiting Values

- Assume the following limiting values for the responses:
 - Significant single amplitudes:
 - Ship roll: 5 deg.
 - Ship pitch: 3 deg.
 - Absolute vertical velocity at ramp: 2 m/sec
 - Depends on ramp (x,y) location
 - Expected number of events per hour:
 - Wetness (relative vertical motion hits zero) events at ramp: 30
 - Depends on ramp (x,y,z) location

Vertical Velocity

All Speeds; Vertical Velocity; Sea State 3; Aft Ramp

Wetness Events

All Speeds; Wetness Events per Hour; Sea State 3; Aft Ramp; Height = 2

Operating Envelope

All Speeds; Operating Envelopes; Sea State 3; Aft Ramp; Height = 2

Operations can be sustained

Operations are unsafe

Design Selection

All Speeds; Operating Envelopes; Sea State 3; Aft Ramp; Height = 1

Ramp height at 2 m above calm waterline provides adequate operability region

Sea State Effects

Low Speeds; Operating Envelopes; Sea State 1; Side Door; Height = 2

2 m clearance provides adequate operating envelope even for elevated sea states

Procurement Cost Estimation Process

- Two methods were used to estimate cost:
 - Top-down method using data from the Congressional Budget Office (CBO), Visibility and Management of Operating and Support Costs (VAMOSC), and others
 - Bottom-up method using detailed weight-based Cost Estimating Relationships (CERs), labor costs, and specialized equipment costs
 - The bottom-up method produced results that were less than 10% lower than the top-down method
 - For brevity, only the top-down method is detailed on the following slides

Platform Comparisons

Ship Class	Type	Displacement (tons)	Crew Size	Armament	Missions	Follow ship procurement cost (FY05 \$M)	O&S (FY05 \$M)
DD(X)	General-Purpose Destroyer	16,000	130	2 Helo, 2 155-mm AGS, 128 VLS	Land attack, ASW	* 3,200	40.8

Top Level Requirements Revisited

- ✓ **Deploy, retrieve, and regenerate large UUVs semi-clandestinely**
- ✓ **Sensor assets required to provide Pd 0.8 across contested OA (6,700 NM2) within 10 days**
- ✓ **Provide logistic support necessary to sustain SoS for 30 days**
- ✓ **Communicate on the following circuits:**
 - High Band Width Air/Space Line of Sight (LOS) - LOS Data
 - LOS Voice - OTH Data
 - OTH Voice - SATCOM
 - Underwater Data
- ✓ **Launch, recover, and control a 7,000 lb UAV**
- ✓ **Deploy box-launcher weapons and torpedoes for enemy engagement**

Conclusions

- **Employs a large, well designed, and flexible Payload configuration**
- **Combat Systems offer a robust mix of Offensive and Defensive capabilities that can conduct simultaneous ASW, SUW, & AAW operations**
- **HM&E design delivers high speed & high power in a unique and efficient manner**

Sea TENTACLE is the platform of choice for Littoral ASW in 2025
